

V-WIRE INFORMATION AND CONSTRUCTION

The Vee-wire slot opening provides only two point contact with sand grains and cannot become plugged as easily.

VEE-Wire Construction

Non-plugging slot design: This design inwardly enlarges to prevent particles from becoming jammed in the slot. Those particles that are near in size to the slot opening simply pass freely through.

Precision fabrication: The screen is a small part of the tremendous cost of an oil well but it is critical to its success. We build every oil and gas well screen under the most rigorous standards.

Open area: The object of down-hole screens is to exclude the sand and admit the most oil and gas possible. Our screens are fabricated with the highest percentage of open area consistent with strength limitations - far more open area than alternative screens allow.
