

HOT OIL TOOL™

Odessa Separator now provides an innovative new product designed and engineered to make hot oil operations more efficient less costly and far less damaging to formations

- 1. Hot oil is pumped down to the depth of the packer and circulated back to the surface. The treating fluid does not go into the formation.*
- 2. A typical hot oil job with the OSI Hot Oil Tool should require only about two hours and will treat much more thoroughly.*
- 3. The well will take far less time to recover.*
- 4. The main purpose of the Hot Oil Tool is to keep the treating oil hot while it does its' job and to keep the treating oil from damaging the formation.*
